

User Journey Mapping

Booking a Movie Ticket via a Mobile Application

Persona & Scenario

Persona:

Name: Arjun Kumar

Age: 32

Occupation: Software Engineer

Scenario:

Arjun wants to book **four tickets** for a Sunday afternoon movie with his family. He is a frequent user of the movie ticket booking app and prefers a quick, hassle-free booking experience. He usually books tickets from his smartphone while commuting home after work.

Stage	Entry Point	Search	Seat Selection	Payment	Confirmation
User Action	Opens the movie ticket booking app from the home screen.	Searches for the movie, selects the city, date, and preferred cinema.	Choose four seats together from the interactive seat map.	Applies loyalty points, selects UPI payment, and confirms the booking.	Receives the e-ticket with a QR code in the app, email, and notification.
Touchpoint	App home screen	Search bar, movie listings, filters	Showtime page, seat map	Checkout page, payment gateway	Confirmation page, email, app notification
Emotion	Positive – familiar with the app	Positive – confident	Slightly anxious about finding four seats together	Neutral – focused on completing payment	Happy – excited for the family outing
Pain Point	Promotional pop-ups slow access.	Too many cinema options to compare.	Difficult to find four adjacent seats during busy hours.	Payment processing is slow.	Confirmation notification arrives late.

Opportunity	The show recently visited cinemas and favorite movies first.	Recommend nearby cinemas with available family seating.	Automatically highlight the best available group seating.	Offer one-tap payment using saved UPI and loyalty points.	Save the ticket offline immediately and send instant confirmation.
